INTERPRET A DATA
VISUALIZATION

Malaria Death in Africa

by Najla Alshehri

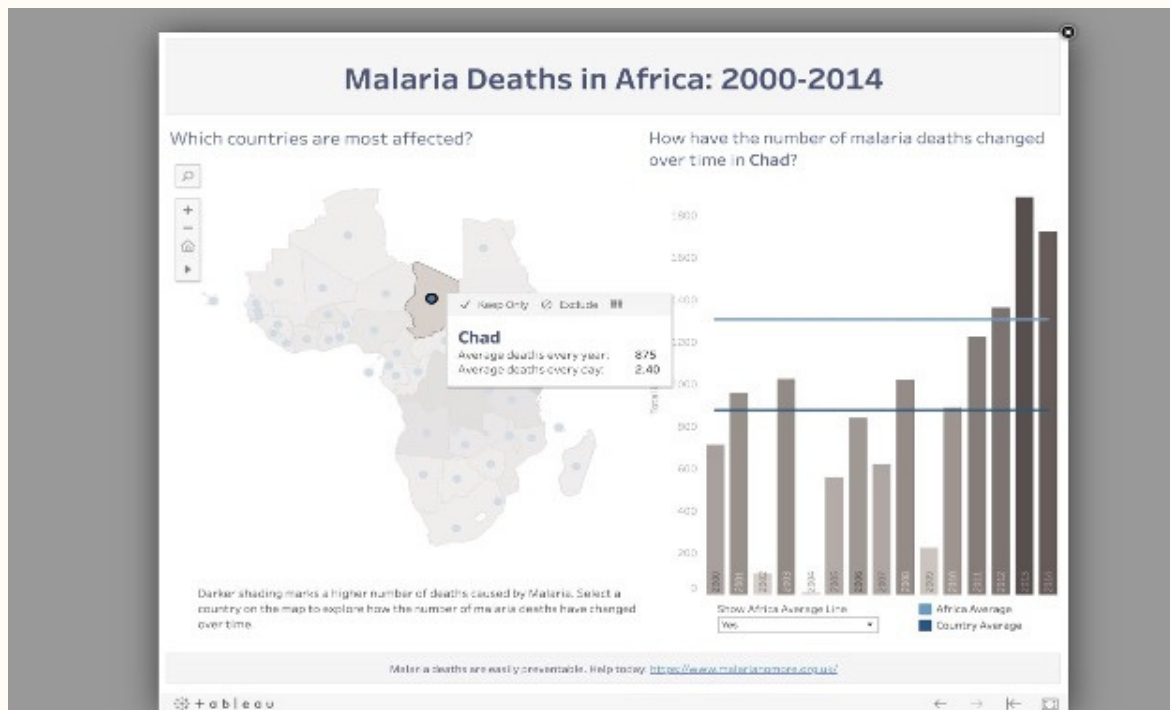

FEB • 2021 • UDACITY NANODEGREE

From the dashboard, Kenya has the darkest shading which shows that it has the highest death rate due to malaria in Africa by 27,896 death on average every year.

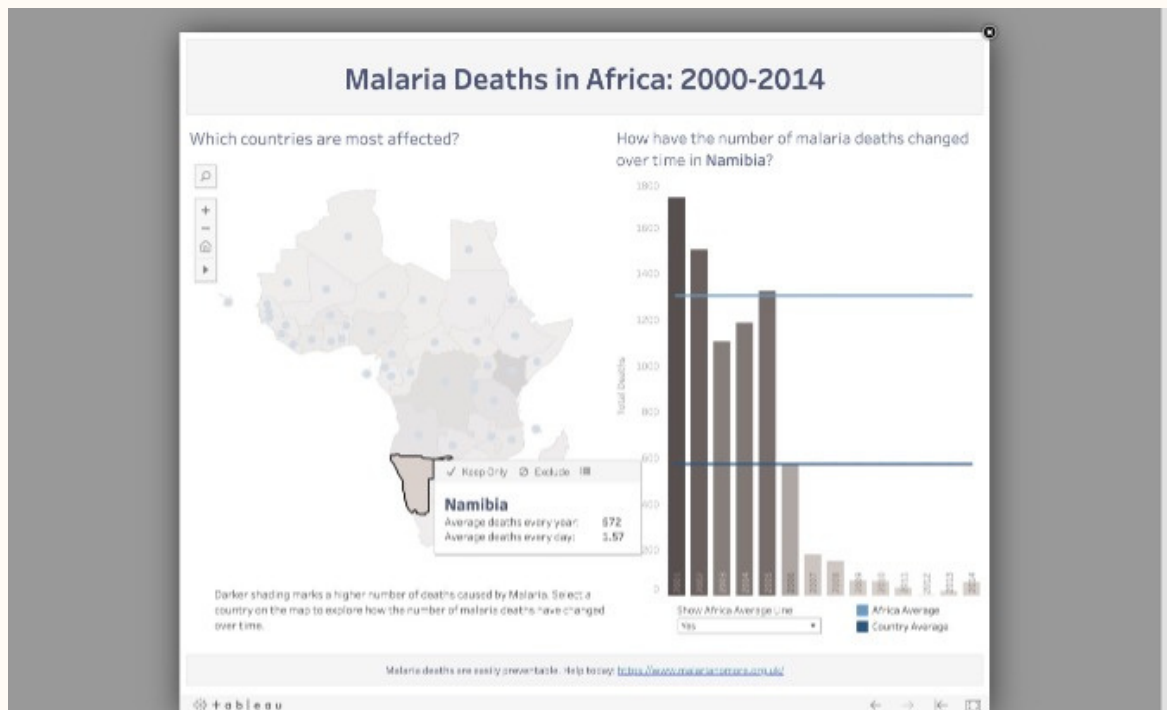

After that, the Democratic Republic of the Congo comes to be the second-highest country affected by malaria.

then Angola and the United Republic of Tanzania have close death rates so they come in third place. On the other hand, Algeria has the lowest death rate in Africa by 1 death every year on average.

I clicked on chad to see how the number of malaria deaths changed over time, the chart shows the insight from the year 2000 to 2014. The number of death due to malaria from the year 2000 to 2010 was wobbling, and then it starts increasing until the year 2013 after that it reduced in the year 2014.

The average death due to malaria was 875 every year, and the highest death rate happened in the year 2013 and the lowest was in the year 2004.

This time I clicked on Namibia, Namibia's insight chart shows how the number of malaria deaths changed over time from the year 2001 to 2014. from the year 2001 until 2003 the death rate was decreasing then it rises again until 2005. In the year 2006, the death rate dropped to about half of the death rates and it kept decreasing until the year 2012 then it rises in the years 2013 and 2014. the highest death rates happened in the year 2001 and the lowest was in 2012.
